

# Tips for Safe Boiler Start Up and Shut Down

## When Starting:

- Check the components between the main valve and non-return valve in order to bleed any air from the system.
- Perform a test to see if the low water cut-off is working at the desired low level.
- Gradually increase boiler pressure by warming up the system at a lower temperature.

## When Shutting Down:

- Make sure the fuel that powers the burner is shut off completely.
- Close the main steam stop valves.
- Open all proper drains to empty the pipes.
- Ensure the boiler feed system is offline.
